

Tri-County Solar LLC

Community Solar Project

Greenwood Sustainable Infrastructure

Who We Are:

Greenwood Sustainable Infrastructure (GSI) – renewable energy subsidiary of Libra Group.

- Developer, owner, & operator of solar + storage projects across North America
- Expertise across the full lifecycle: origination → financing → construction → long-term operations
- 388 MW built across 71 renewable projects
- 2.4 GW pipeline

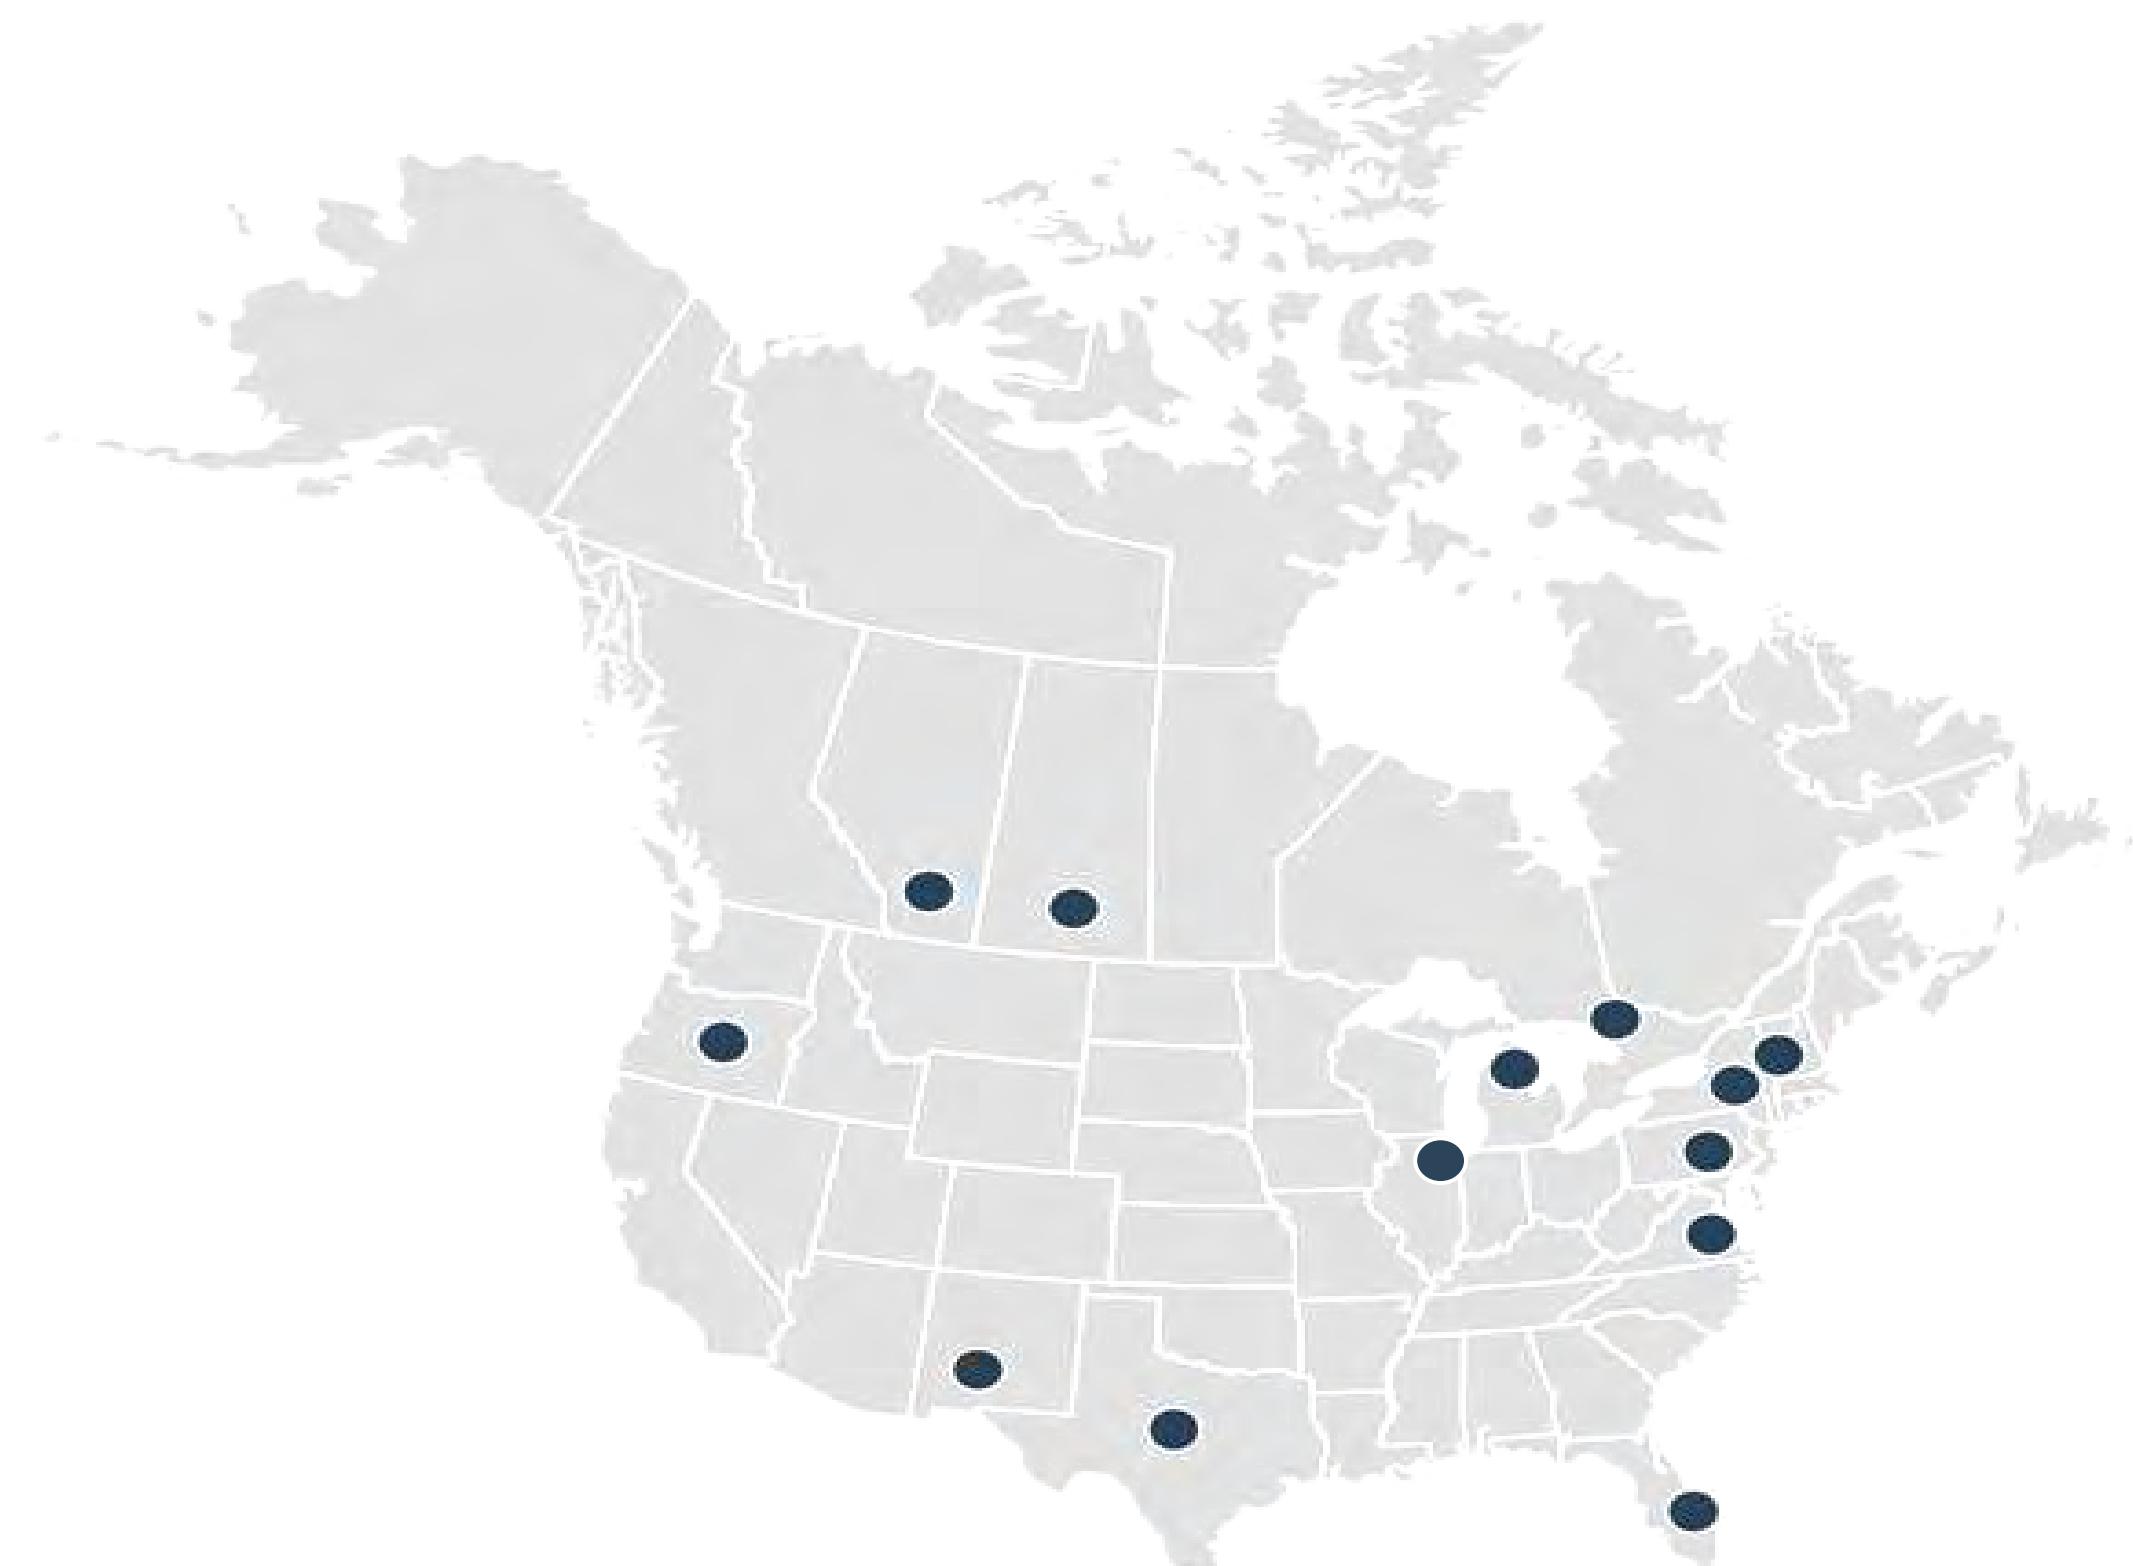

Greenwood Sustainable Infrastructure

Current Operating Portfolio

Solar & Biomass

- 17 Assets
- 60 MW-dc
- 5 States

Professional Experience

Solar, Wind, Storage, CHP

- 71 Assets
- Over 388 MW-dc
- 13 States / 2 Provinces

Greenwood Sustainable Infrastructure

Project Overview

Tri-County Solar is a 5 MW-AC community solar project proposed on the Tri-County Landfill

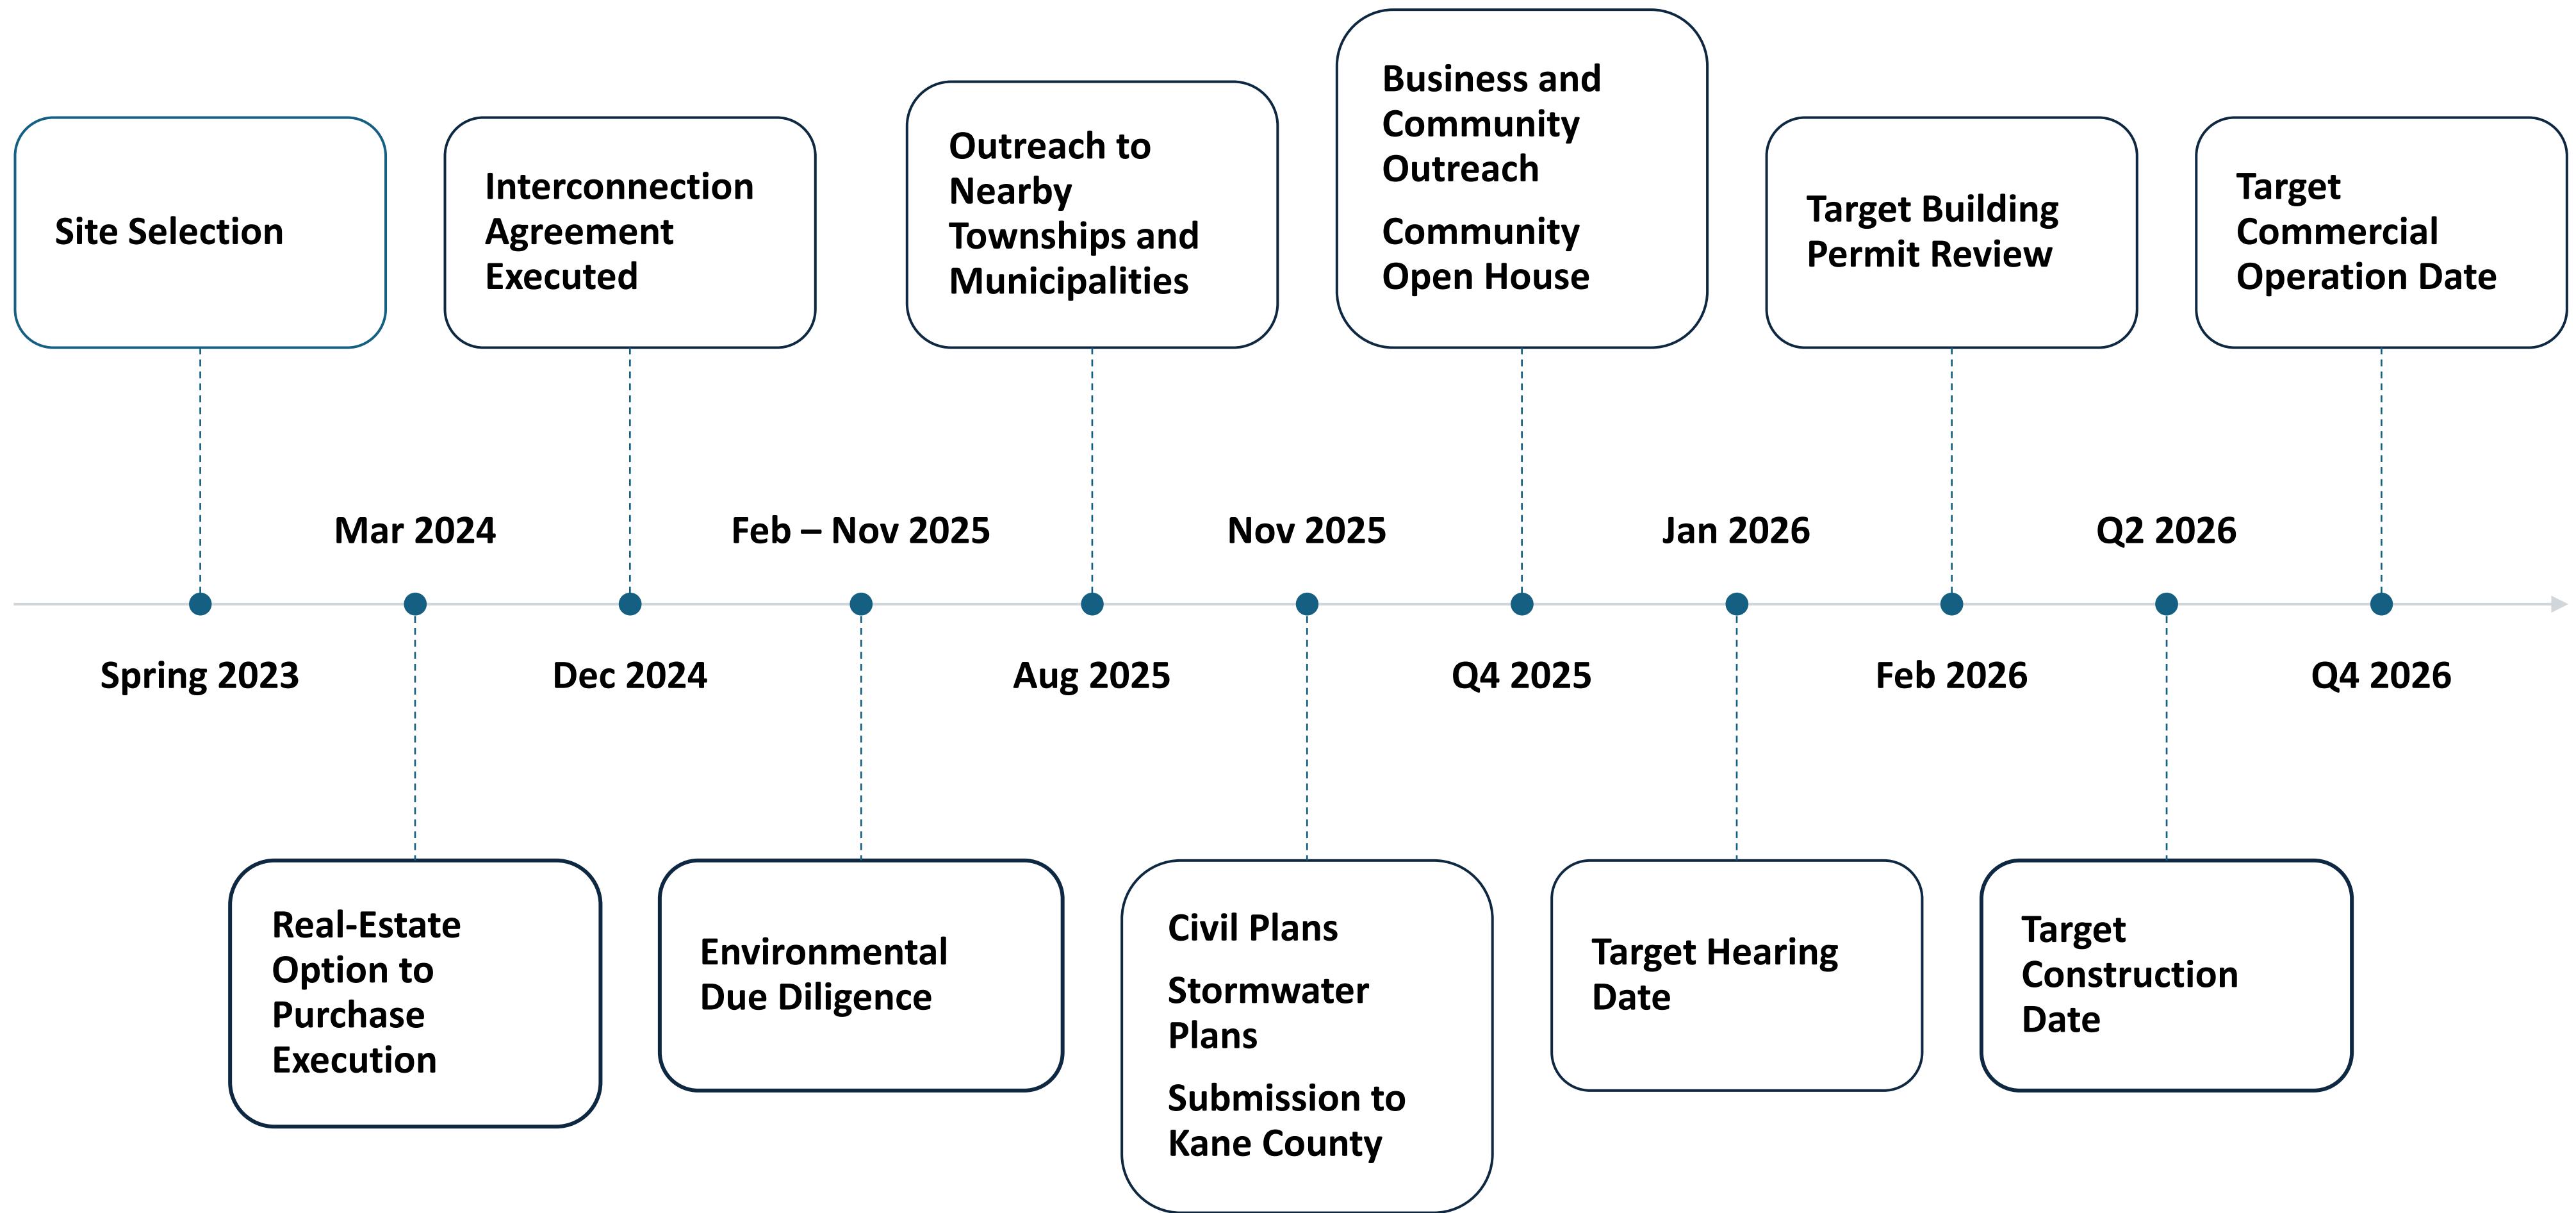

- Converts a closed unusable landfill into a productive brightfield solar project.
- This EPA Superfund Site has been deemed ready for solar reuse.
- Solar use is also encouraged under Illinois Shines' Built Environment category as a CERCLA brownfield.
- No ground penetration — fully ballasted system, to protect the landfill.
- Collaboration underway with Waste Management (site operator) and the landowner.

What is a Brownfield?

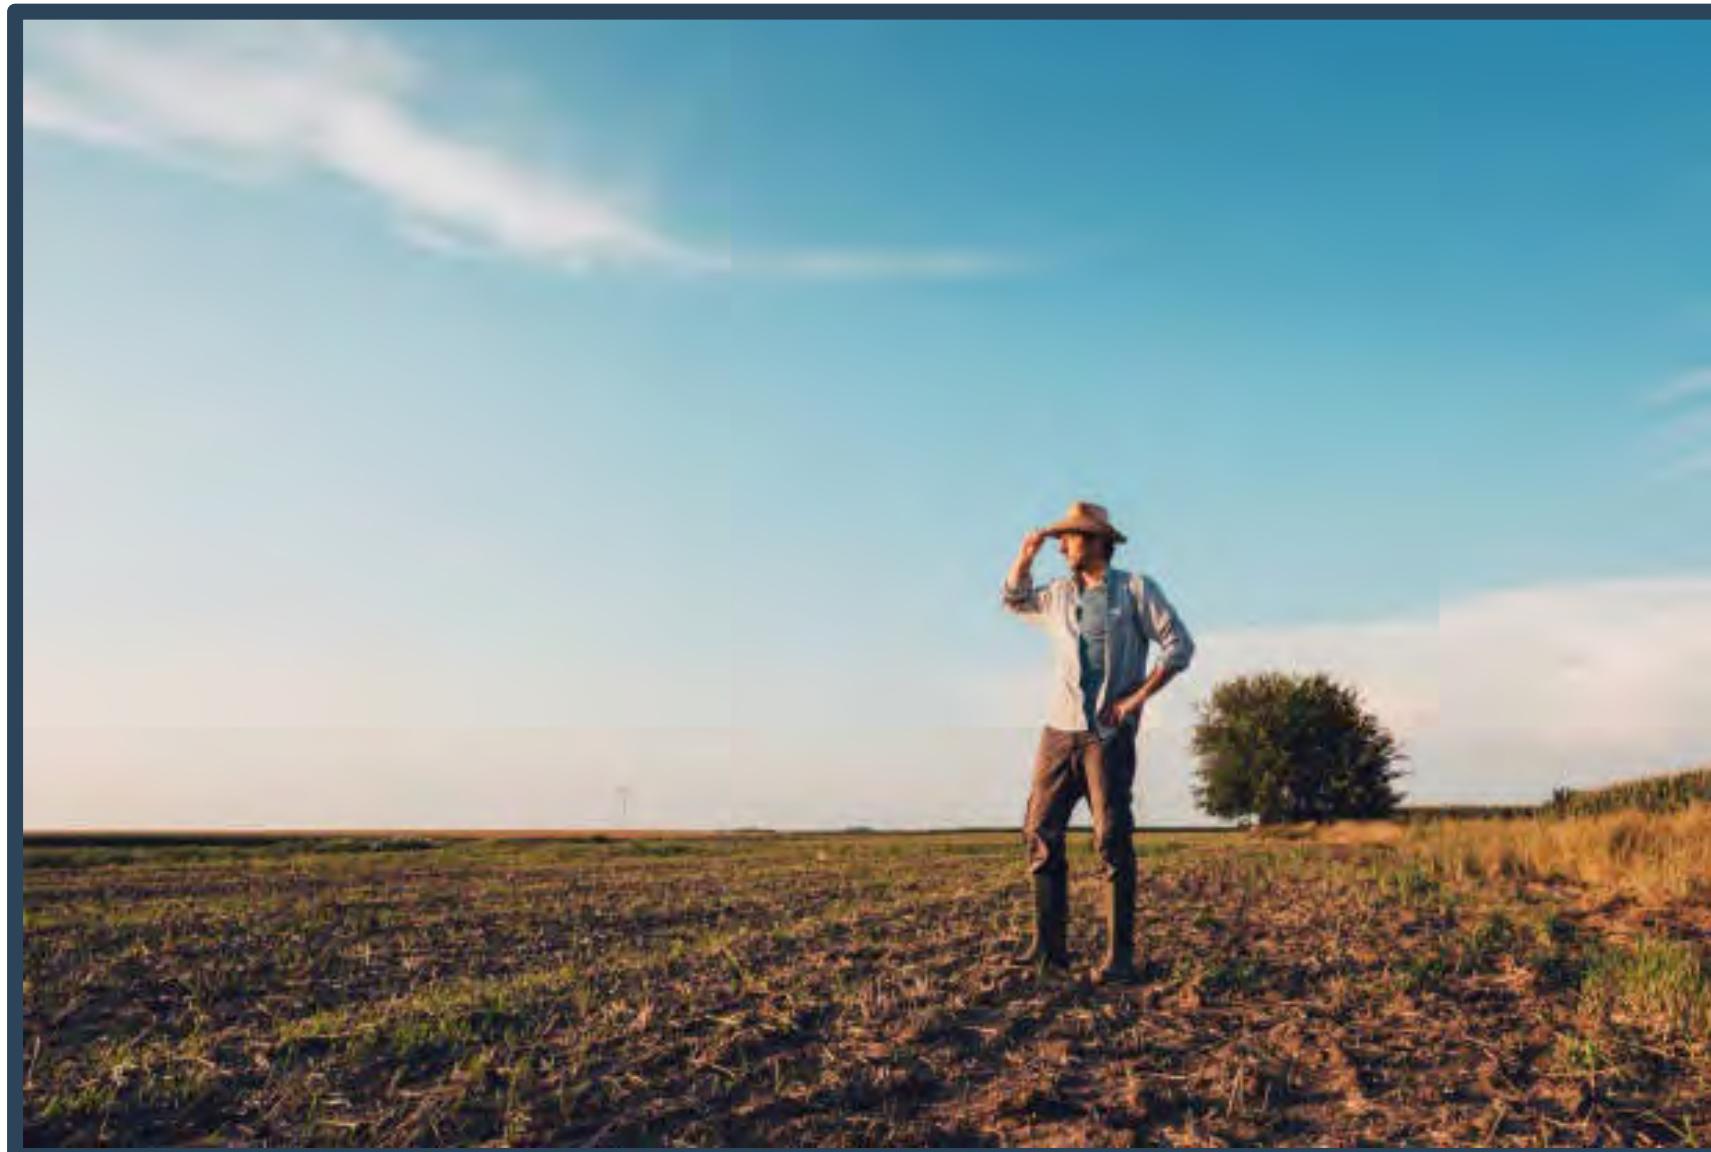

Brownfields are properties, like landfills, that currently have hazardous substances, pollution, or contamination. These sites come with **land use restrictions** and require ongoing remediation.

Since, after waste is dumped, landfills become brownfields, they require complicated permitting and can go **un-used for decades**.

Tri-County has gone through over **25 years of remediation**, and the EPA has deemed it ready for solar reuse.

Why at the Landfill?

- The USEPA has determined that this site cannot be used for agricultural, residential, commercial, or business development.
- Preserves farmland by developing solar on a closed landfill, instead of the standard solar location, on agricultural lands.
- As a Superfund Site this is the only productive use of the site that is possible with returning the site to its original condition at the end of use.
- Allows the community to have economic benefits without having visible panels.

Construction Considerations

We have completed thorough **due diligence**, making sure no construction activity will impact the **integrity** of the landfill or environment. This planning has included:

- Using a ballasted system, to prevent any impact to the integrity of the landfill cap.
- Putting up perimeter fencing to mitigating impact to wildlife.
- Limiting site grading, to reduce wildlife impact.
- Waiting to construct until receiving all approvals, environmental studies, and detailed engineering designs.

Pollinator Friendly Habitat Plan

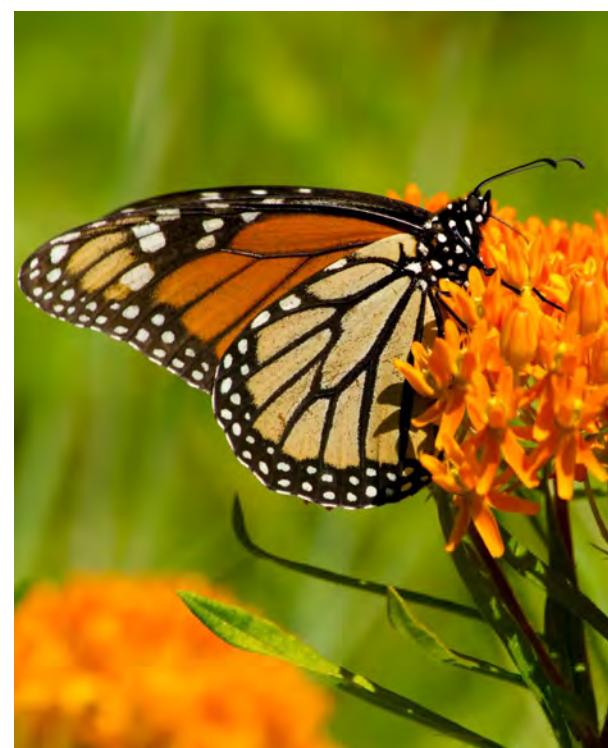

- Tri-County's primary landscaping goal is to establish permanent pollinator friendly vegetation throughout the site.
- The site will plant 100% native species.
- Native mix planned for this array was selected for ecological appropriateness to the soil, moisture and site conditions.
- Low-maintenance vegetation that won't require fertilizer, amended soils, or irrigation on site.
- Native grasses, forbs, and pollinators.

Common Yarrow

Butterfly Milkweed

Creeping Red Fescue

Great Blue Lobelia

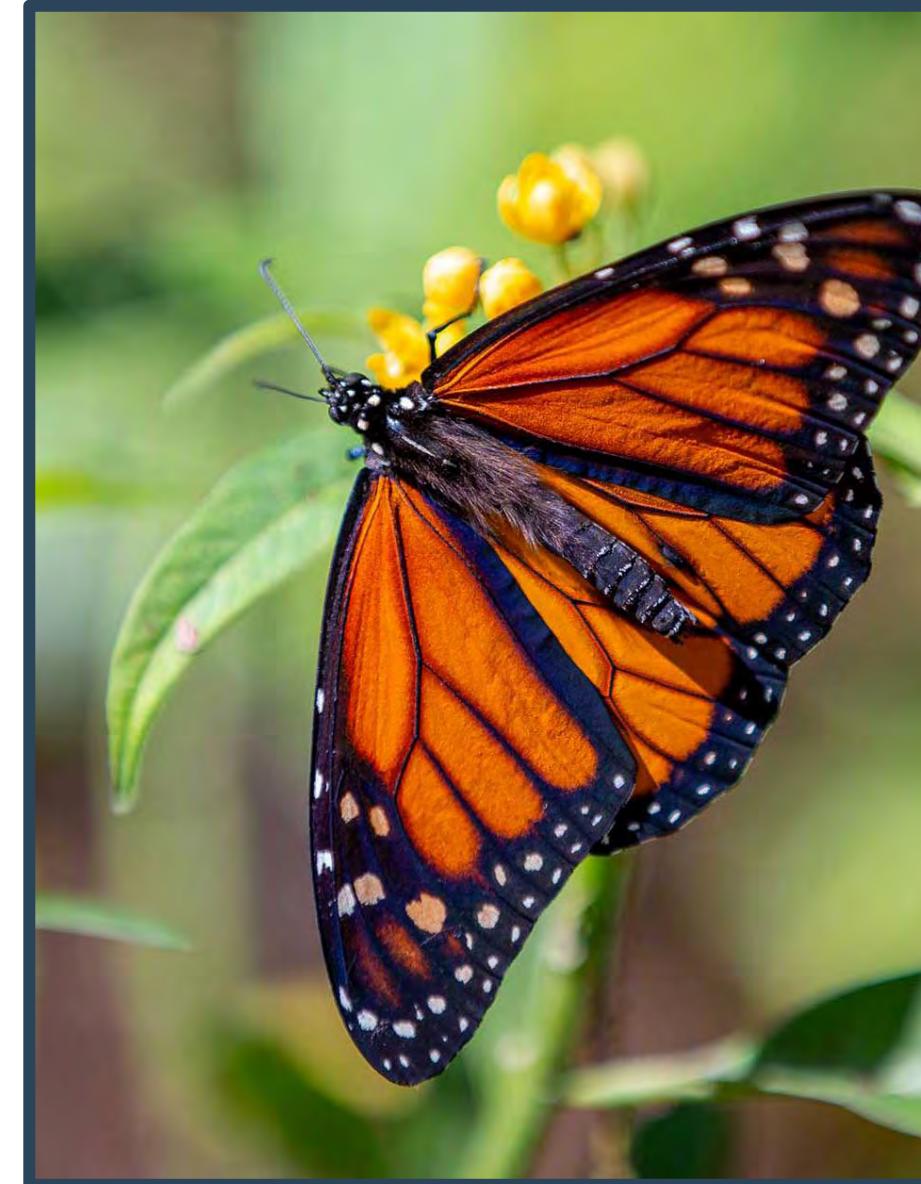

Wildlife Conservation

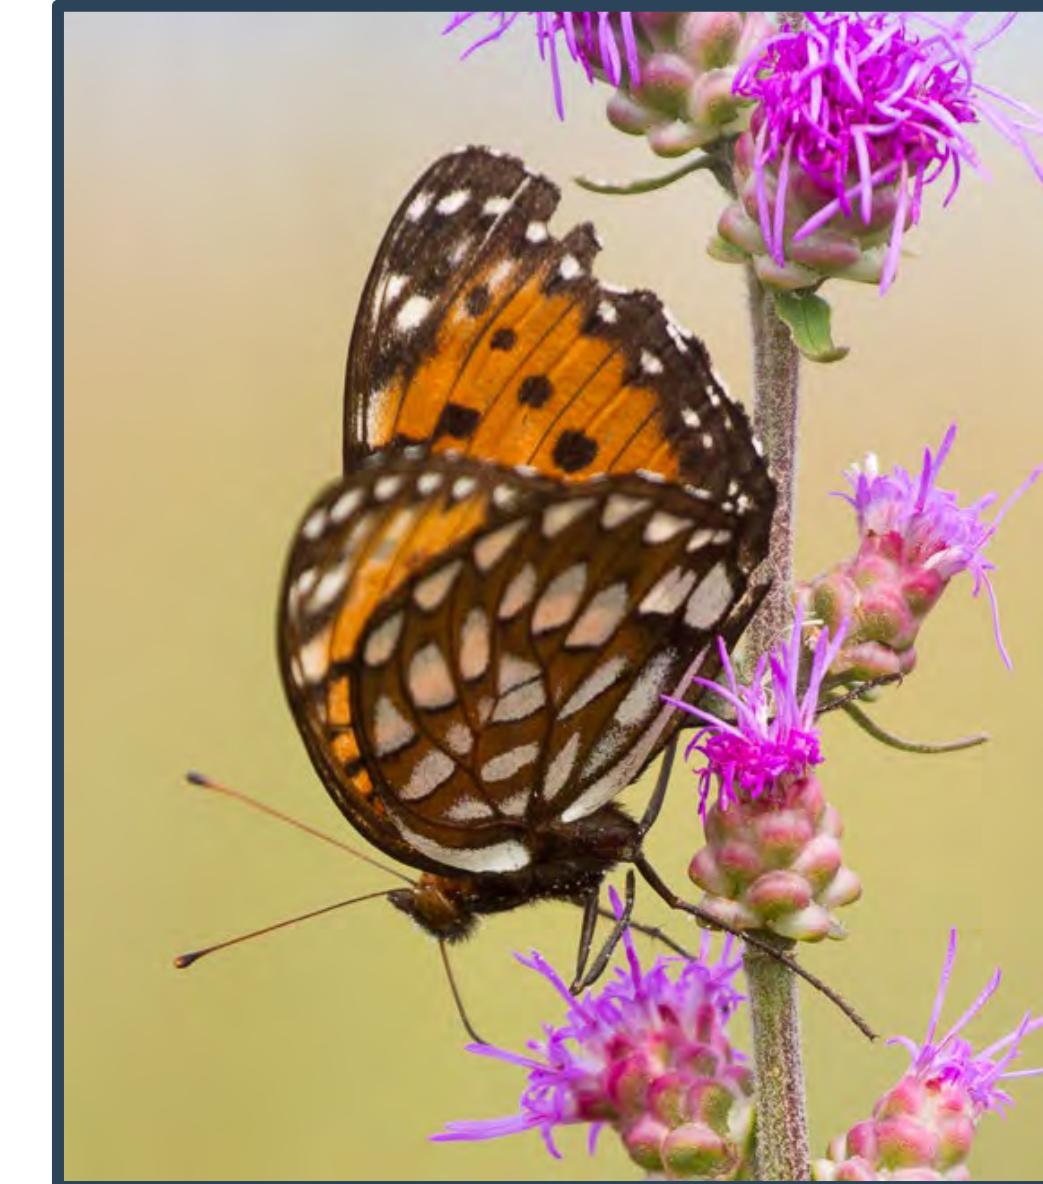

The Pollinator Friendly Habitat Plan will help candidate species, including:

**Rusty Patch
Bumble Bee**

**Monarch
Butterfly**

**Western Regal
Fritillary Butterfly**

Blanding Turtle Conservation Plan

The project proactively developed a conservation plan including:

- Pre-construction training on identification, behavior, habitat awareness, and no-contact protocols.
- Specialized Construction Monitors, trained and involved in site decisions and operations.
- Temporary fencing, daily visual inspections, and stop-work procedures with IDNR notification.
- Any open holes will be secured or filled to prevent wildlife entrapment.

Risk has been mitigated by using all IDNR's recommendations.
